TREATMENT

REVO NAP LASER TREATMENT FOR GUM DISEASE

DR DIX PREMSINGH PRASATH

DATE

04/04/2024

PATIENT

2

Patient No. 2 attended with complaint of loose upper front teeth and the teeth has moved out its space.

Examination revealed advanced gum disease (periodontitis) with pus exudate in multiple locations.

This advanced periodontal disease condition was treated with our unique REVO NAP (Revolutionised New Attachment Procedure) technique. Once the gum disease was stabilised, aligners were used to straighten the teeth.

We managed to stabilise the teeth with out the need to extract along with stopping halitosis.

Observe the before and after photos where the inflammation is completely eliminated, pus seen in before photos is completely eradicated.

Multi-speciality approach used to get a stable, pleasing outcome.
